

Tidewater Lighthouse Maintenance Log

Overview

This log records the quarterly inspection of the Tidewater lighthouse and its supporting equipment. The structure has operated continuously since its last refit and remains within expected tolerances. Routine maintenance keeps the optic, the rotation drive, and the backup power chain in service.

Inspection Schedule

Inspections run on a fixed quarterly cadence. Each visit covers the optic assembly, the structural envelope, and the electrical systems in that order.

- Clean the optic and verify the lamp changer rotates freely.
- Check the gallery railing and the access ladder for corrosion.
- Test the backup generator under load for thirty minutes.

Equipment Checklist

The following items must be confirmed present and serviceable before the inspector signs off:

- Spare lamp set, sealed and dated.
- Hand winch with an intact safety pawl.
- First aid kit within its expiry window.

Observed Conditions

Visibility readings were taken at dawn from the gallery deck.

Date	Visibility	Notes
2026-04-10	Good	Light haze offshore, cleared by midday.
2026-04-11	Poor	Dense fog; foghorn engaged for six hours.
2026-04-12	Good	Clear horizon, calm sea state.

Recommendations

The inspector recommends the following actions before the next quarter:

1. Replace the gallery railing fasteners showing surface rust.
2. Schedule a load test of the secondary battery bank.
3. Restock the spare lamp set to the full complement of four.
